 AB - J52057313 Insulin emulsion for oral use is prepd. by adding insulin,
 pharmacologically inactive alkali metal salt of bile acid and water to
 a fused mixt. of higher fatty acid and higher fatty acid
 monoglyceride and shaking the mixt.
 - The insulin isolated from cattle, swine or whale, is used or its metal
 complexes (e.g. Zn complex) or protamine Zn insulin or globin
 insulin. The higher fatty acids are palmitic acid, stearic acid, oleic
 acid, linoleic acid, etc. The bile acid is cholic acid, deoxycholic acid,
 taurocholic acid, glycocholic acid, etc. Water of a buffer soln. or
 dilute HCl is used. The ratio of each component in 1 l. of the soln.
 is : insulin 5,000-100,000 unit (U), higher fatty acid 20-400 mmole,
 the monoglyceride 10-200 mmole, alkali metal salt of bile acid
 50-300 ml. It is possible to add a stabiliser or preservative.
